

GETTING STARTED · PICO-CLI

Build a PICO Spatial app with Claude, from zero

Install the CLI, connect it to Claude Code, and get a first Spatial SDK app running on the PICO emulator.

One command line for spatial app work

Create projects

Scaffolds a Kotlin app on the PICO Spatial SDK from a planar, volumetric or stage template.

Run and debug

Starts the PICO emulator, installs and launches apps, and captures screenshots and logs.

Plug into your agent

Installs PICO skills and the PICO docs server into Claude Code.

Three things to have installed

Node.js 18+ and npm

Used to install pico-cli and Claude Code.

Android Studio 2025.1+

With Android SDK Platform 35 and its Sources. Gradle pulls in the PICO Spatial SDK through the project template.

An Anthropic account

A Claude subscription or an API key, used to sign in to Claude Code.

STEP 1 OF 7

Install Claude Code and sign in

Claude Code is the agent that pico-cli connects to.

Run `claude` once, then follow the prompt to sign in with your Anthropic account.

zsh

```
$ npm install -g @anthropic-ai/claude-code  
$ claude # first run signs you in
```

STEP 2 OF 7

Install pico-cli

Install it globally from npm, then run `--help` to list the command families.

Real output · `pico-cli 0.4.2` · `0.5.0` is out

```
pico-cli --help
```

```
$ npm install -g @picoxr/pico-cli
```

```
$ pico-cli --help
```

Commands:

setup	AI tool integrations and skills
project	Create and bootstrap Spatial projects
emulator	Emulator lifecycle and diagnostics
device	Device connectivity and inspection
app	Install, launch, and inspect apps
capture	Screenshots and recordings
log	Logcat from the current target
doctor	Top-level environment diagnostics
update	Check for and install updates
perf	Performance utilities

STEP 3 OF 7

Connect pico-cli to Claude

setup installs the pico-spatial-agentic-tools plugin: PICO skills plus the pico-dev-knowledge docs server.

Restart Claude Code afterwards so it loads them.

zsh

```
$ pico-cli setup --tool claude-code \  
    --platform spatial  
  
--tool  claude-code | cursor | codex | copilot | all  
-y      accept the setup plan without prompting
```

STEP 4 OF 7

Run the doctor and fix what it flags

Each failed check prints the command that fixes it.

The most common gap is Android SDK Platform 35. Install it from Android Studio's SDK Manager.

Real output · a Mac mid-setup

```
pico-cli emulator doctor
```

```
$ pico-cli emulator doctor
```

```
Emulator Environment
```

```
- [ok]      Android Studio 2025.1.x detected
- [error]   Android SDK Platform 35 missing
           Fix: pico-cli emulator setup --launch-studio
- [ok]      Primer SDK diagnostics completed
- [ok]      PICO Spatial Plugin detected
- [ok]      PICO Emulator is available
pico-cli 0.5.0 is available. Run: pico-cli update
```

STEP 5 OF 7

Create a Spatial SDK project

planar: panel-first, mostly 2D UI

volumetric: 3D models and showcases

stage: immersive, room-scale experiences

A terminal window with a dark background and light-colored text. The window has three colored window control buttons (red, yellow, green) in the top-left corner. The title bar of the window says "zsh". The terminal shows two commands being executed. The first command is "pico-cli project create" followed by several options: "--template volumetric", "--name demo", "--dir demo", and "--package com.example.demo". The second command is "cd demo" followed by "&& ./gradlew assembleDebug".

```
zsh

$ pico-cli project create \
  --template volumetric \
  --name demo --dir demo \
  --package com.example.demo

$ cd demo && ./gradlew assembleDebug
```

STEP 6 OF 7

Run it on the emulator

The first emulator start downloads the emulator.

Add `-d <id>` to target a headset, and `--format json` for output a script can parse.

zsh

```
$ pico-cli emulator start
$ pico-cli app install \
    app/build/outputs/apk/debug/app-debug.apk
$ pico-cli app launch com.example.demo
$ pico-cli capture screenshot --out shot.png
$ pico-cli app logcat --level E # if it breaks
```

STEP 7 OF 7

Or just ask Claude to do it

With the plugin installed, describe the app. PICO skills run steps 5 and 6 for you: scaffold, build, launch, screenshot and fix errors.

claude

```
$ mkdir globe && cd globe && claude  
> Create a volumetric PICO Spatial app  
that shows a slowly rotating globe, run  
it in the emulator and send me a screenshot.
```

- Skill: spatial-app-onboarding
- pico-cli project create --template volumetric
- pico-cli emulator start
- pico-cli app launch com.example.globe

IF YOU GET STUCK

Three commands fix most problems

Claude can't see the PICO tools

```
pico-cli setup --tool claude-  
code  
then restart Claude Code
```

Something is missing

```
pico-cli doctor  
then run the fix it prints
```

Not sure of a command

```
pico-cli <family> --help
```
